Stainless Steel

Stainless Steels (Iron alloys) generally contain from 12 to 30 per cent Chromium and from 0 to 20 per cent Nickel. This formulation can then be further modified by additions of Carbon and other minor elements. These additions are made to obtain specific effects; i.e. to control mechanical properties or to improve corrosion resistance. As a result stainless steel fasteners possess superior strength and offer considerable resistance to corrosion and elevated temperatures over plain carbon and lower alloy type fasteners.

Stainless steels may be divided into three general classifications:

1. **Martensitic.** Straight chromium, hardenable. Martensitic stainless steel contain from 12 to 20 percent chromium. They may be cold worked with reasonably good result and hot forged with limitations. They are generally used because of their ability to be hardened and tempered by heat treatment. They are also magnetic. Commonly these are the Type 410 and 416 fastening alloys.
2. **Ferritic.** Straight chromium, non-hardenable. These may be hot forged with better results than the Martensitic Steels and may also be cold worked with reasonably good results. These are magnetic and are not hardenable by heat treatment. These are more economical than Austenitic steels but do not have the corrosion resistance that they offer. These are typically Types 430 and 430F fasteners.
3. **Austenitic.** Chrome-nickel, non-hardenable. These make up the 18-8 (or 300) series of fasteners. 18-8 was the original chrome-nickel ratio, but many modifications have been made in the ratio. Small percentages of molybdenum, columbium, or titanium may be added to obtain special characteristics; i.e. increased corrosion resistance, to grain growth when welded, etc. These are not hardenable by heat treatment, non-magnetic, and offer the greatest resistance to corrosion. Some grades are highly resistant to heat. All grades of austenitic work harden very rapidly at room temperature and some grades hot forge fairly well.

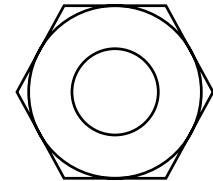

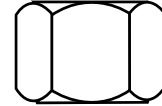

Stainless steel fasteners have almost as many uses as there are problems of corrosion, temperature and strength. Stainless steel is a very versatile metal due in part to its high tensile strength, corrosion resistant qualities and ability to attain a mirror-like finish. It is typically used in the petroleum, chemical, food, plumbing, transportation and oil equipment industries. These are just a few of its applications.
